                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  85
                                                                                                                                                                                     ION CONCENTRATION ON EITHER SIDE OF THE MEBBANE. ACTS AS AN OUTWARD RECTIFIER WHEN EXTERNAL POTASSIUM CONCENTRATION IS LOW. WHEN EXTERNAL POTASSIUM CONCENTRATION IS HIGH, CURRENT IS INWARD. SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN (POTENTIAL). TISSUE SPECIFICITY: WIDESPREAD EXPRESSION IN ADULT. STRONGEST EXPRESSION IN PANCKRAS AND PLACENTA. LOWER EXPRESSION IN BRAIN, LUNG, PROSTATE, HEART, KIDNEY, UTERUS, SMALL INTESTINE AND COLON. MISCELLANBOUS: INHIBITED BY EXTERNAL ACTIVATED BY HEALOTHANE AND ISOFLURANE.
                                                                                                                                                                                                                                                                                                                                  FUNCTION: PH-DEPENDENT, VOLTAGE-INSENSITIVE, BACKGROUND POTASSIUM CHANNEL PROTEIN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of human TASK1 (TWIK-related acid-sensitive K+ channel), a member of a new family of 2P domain potassium channels, also including TWIK-1 (see AAY79673) and novel TASK2 (see AAY79675). TASK1 is expressed in many different tissues, and at particularly high levels in pancreas and placenta. Host cells expressing TWIK-1 family members can be used to screen for substances that modulate the activity of members of the TWIK-1 family of potassium channels. The drugs identified may be useful in the treatment of diseases of the heart or of the nervous system, such as epilepsy, arrhythmia, vascular diseases, neurodegenerative diseases, kidney, liver or pancreas diseases, hypertension, diseases associated with anomalies of hormone secretion, and muscle diseases associated with anomalies of hormone secretion,

                                                                                                                                                                                             reproductive or developmental disorders, (e.g. arteriosclerosis, clirhosis, psoriasis, acquired immune deficirry syndrome, anaemia, asthma, Crohn's disease, microbial or other protions, congestive or ischaemic heart disease, Alzheimer's, Parking sor Huntington's diseases, schizophrenia, ovulatory defects, rescular dystrophy). HSPP nucleic acids can be used for the recombinant conduction of HSPP, for detecting HSPP in standard hybridisation and implification assays (for diagnosis and monitoring), in gene therapy, as antisense, triplex-forming or ribozyme therapeutics, for detecting related sequences or genetic variations, and for chromosomal mapping. HSPP are also used to raise specific antibodies (Ab) and to screen ior agonists and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; signal peptide-containing protein; HSL. 31 diagnosis; cancer; inflammation; cardiovascular disease; antic; anti-inflammatory; antimicrobial; nootropic; neuroprotective; car. ovascular; hepatotropic, antiasthmatic; gene therapy; cell proliferation; neurological disorder; reproductive disorder; developmental disorder; arteriosclerosis; clirhosis; psoriasis; acquired immune deficiency syndrome; anaemia; asthma; Crohn's disease; infection; Alzheimer's disease; schizophrenia; parkinson's disease; Huntington's diseases; ovariatory defect;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of murine TASK .....K-related acid-sensitive K+ channel), a member of a new tamily of 2P domain potassium channels, also including hus in TWIK-1 (see AAY79673), human TASK1 (see AAY79674) and nowed human TASK2 (see C AAY79675). Human and mouse TASK proteins shore 95% identity, indicating that they are products of ortho or genes. Host colls expressing TWIK-1 family members can be used to screen for substances that modulate the activity of the TWIK-1 family of potassium channels. The drugs identify of useful in the treatment of diseases of the TWIK-1 concerns of the TWIK-1 neurodegenerative diseases, kidney, liver of the nervous system, such as epilepsy, arrhythmia, vascu. I is is a or anoxia, endocrine diseases associated with anomalies in hormone secretion, and decreased associated with anomalies.

The polypeptide is a member of the potassium channel family. The DKCN1 polypeptides and polynucleotides are useful for treating diseases including cancer, pulmonary, cardiovascular, inflammatory or renal diseases, pain, psychiatric disorders including depression and schizophrenia, neurodegenerative disease including depression and schizophrenia disorders, migraine, epilepsy sleep-related disorders, erectile dysfunction and alopecia. DKCN1 polynucleotides are useful as diagnostic reagents for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is encoded by an express is sequence tag (EST) which is related to a cDNA encoding a human DKCN1 po ypeptide. The polypeptide is a member of the potassium channel family. The DKCN1 polypeptides and polynucleotides are useful for treating diseases including cancer, pulmonary, cardiovascular, inflammatory or reval diseases, pain, psychiatric disorders including depression and schizophrenia, neurodegenerative disease including Alzheimer's, neurological disorders, migraine, epilepsy, sleep-related disorders, ectile dysfunction and alopecia. DKCN1 polynucleotides are useful as liagnostic reagents for detecting mutations in the associated gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 12;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polypeptides and polynucleotides of the potassium channel family, useful for identifying agonists/antagonists of herapeutic use an diagnosis and treatment of cancer, pulmonary, ordiovascular,

The present sequence represents tandem pore domain weak inward potassium (K+) (TWIK) polypeptide. The specification describes TWIK2, TWIK3, TWIK4, TWIK5, TWIK6, TWIK7, and TWIK1. The TWIK channel nucleic acids and proteins are used in screening assays to identify candidate compounds which are potential pesticides or therapeutics. The TWIK channel nucleic

The TWIK channel nucleic acids can be used for generating mutant phenotypes in animal models or in living cells that can be used to study the ion channels, their regulation, and their use as pesticide or drug targets, and as hybridisation probes and replication/amplification primers. TWIK channel proteins are useful as immunogens to generate monoclonal or polycional antibodies, and in assays to identify molecules that would specifically bind to them. Genetically engineered metazoan invertebrate animals may be used in studying TWIK channel activity, and for screening and identifying new drug targets, therapeutic agents, diagnostics and prognosis useful in treating disorders associated with ion channels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (K+) (TWIK) polypeptide. The specification describes TWIK2, TWIK3, TWIK5, TWIK6, TWIK7, and TWIK1. The TWIK channel nucleic acids and proteins are used in screening assays to identify candidate compounds
